1. Precautions

Warning: Please abide by the following precautions in order to conduct the maintenance procedures in a safety fashion.

1-1. Caution when doing repairs

- Do work after extinguishing fire in the surrounding area. When freon-gas makes contact with the heater, hazardous gas will leak out.
- · Don't use welding machines in confined indoors.
- In the case of gas leakage, always open the windows.
- When cutting the SUCTION, DISCHARGE pipe of the compressor, always take caution of the inner pressure of the remaining gas.

1-2. Take out the power plug

• Always take out the power plug from the outlet when doing repairs.

1-3. Be careful of electric shocks

• When inspecting the circuit, don't touch the battery charger and be careful of electric shocks.

1-4. Use proper components

• Always use the component labeled in the service component chart when replacing components for repairs.

1-5. Use proper tools

- Always use proper tools for repairs. If worn out tools are used, it would cause defects in tuning and electrical contact, leading to accidents.
- 1-6. When doing repairs, inspect the **POWER**

CORD or whether there is fire in the lead wire and make sure they are replaced.

1-7. Cutting of LEAD-WIRE

• For connecting the lead-wire that has been cut off, use soldering or connector and always disconnect the vinyl tapes.

1-8. Check for disconnection

• After completing the assembly, always measure the disconnection resistance level, and turn on the power after checking it is above 1M.

1-9. Earth

• Check the status of earthing and repair the incomplete ones.

1-10. Be careful of children

• There is always the possibility of danger involved so make sure children can't come nearby when doing repairs.

Cleaning: After completing repairs, clean the surrounding area and the refrigerator and tell the consumer about the repairs being made.

Reference2 Inspection of Relay

- * First separate the housing connected to the main PCB CON C8, 09, 10 and measure the following items.
- 1. Measure the coil bisection of the relay and check whether it works.
- 2. Measure the apex bisection for open circuit.

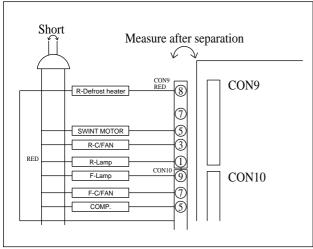

| Apex category | The voltage of coil bisection | Judging the apex bisection |
|---------------|-------------------------------|----------------------------|
| | DC 12V(Operation) | C:NO SHORT |
| Apex 3 | DC 12 v (Operation) | C:NC OPEN |
| Apex 3 | DC 05V(Standstill) | C:NO OPEN |
| | DC 03 v (Standstill) | C:NC SHORT |
| Anov 9 | DC 12V(Operation) | SHORT |
| Apex 2 | DC 0V(Standstill) | OPEN |

Note) C Common, NO Normal open, NC Normal close

3. When it operates as above, it is normal and when it does not operate, report the corresponding relay.

Reference3

Check for malfunctioning of the subordinate

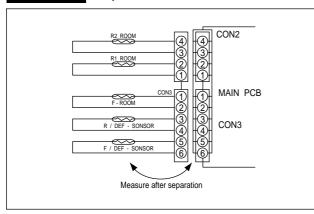

Note) The compressor is impossible to measure resistance by the running and starting condenser.

- * Cut off the power code, separate the housing from the main PCB CON 08, 09, 10 and measure the following.
- 1. Measure resistance between the terminals and check for malfunctioning of L/W.

| Subordinate | Measurement terminal | Evaluation of mea- surement result | | |
|-------------------|----------------------|---------------------------------------|--|--|
| R Defrost heater | CON9 9 & CON10 3 | | | |
| F Defrost heater | CON8 3 & CON10 3 | 0 or (defect) | | |
| Comp | CON8 5 & CON10 5 | Impossible to measure 0 indicator | | |
| Swing motor | CON8 ① & CON9 ⑤ | 0 or (defect) | | |
| R-Circulation fan | CON8 ① & CON9 ③ | | | |
| F-Circulation fan | CON8 ① & CON10 ⑦ | | | |
| R-Lamp | CON8 ① & CON9 ① | | | |
| F-Lamp | CON8 ① & CON10 ⑨ | | | |

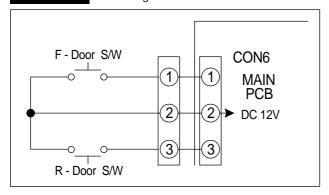

Reference4

Inspection of the sensor

- * Separate the housing connected to main PCB CON2 and CON3.
- * Resistance value lowers while temperature rises, because it is a NTC type sensor.
- 1. R1 sensor measures resistance of CON2 between ①~②.
- 2. R2 sensor measures resistance of CON2 between ③~④.
- 3. Freezer sensor measures resistance of CON3 between $\bigcirc \sim 2$.
- 4. R-defrost sensor measures resistance of CON3 between 3~4.
- 5. F-defrost sensor measures resistance CON3 between 5~6.
- 6. The measurement value above is calculated by comparing the present temperature of the sensor and the temperecture table in specification found in the manual.

Reference5 Checking the Door S/W

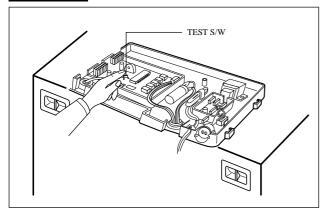

(Refrigerator Bulb)

- 1. Open the door and check if the freezer bulb turns on.
- 2. Press the Door S/W and check if the freezer bulb turns off.
- 3. Close the door of freezer and repeat 1 and 2 for refrigerator.
- 4. If there is a problem, check bulb and door S/W.
- 5. Check wire connection.

(Micom signal)

- 1. Check if CON6 ① and ③ is 0V DC after closing the F·R doors.
- 2. Check if CON6 ① is 12V DC when opening F door. Check if CON6 ③ is 12V DC when opening R door.
- 3. If there is problem, check door S/W and wire connection.

Reference6 Forced starting & forced defrosting

(Forced starting)

- * This function is used to turn on the comp and fan immediately regardless of the temperature of freezer.
- 1. Press the button on the PCB after removing the main PCB cover from the upper part of refrigerator.
- 2. Buzzer will sound to indicate the forced starting.

(Forced defrosting)

- * This function is used to turn on the defrosting regardless of defrost time.
- Press the button twice during forced starting.
 Then, defrosting is performed.
- 2. If the button is press 3 times during R-defrosting, F-defrosting is also performed at the same time.
- 3. If the button is pressed 4 times during R-f defrosting, test mode is released.

Sensor resistance and voltage conversion table for temperature

(Sensor pressure voltage 10K - Voltage converted by the F-reference)

* Voltage conversion table depends on H/W structure of MICOM port input voltage.

Sensor Short : Micom 0V. Sensor Open : Micom 5V.

* Sensor partial pressure resistance 10K

| TEMP. | Resistance K ± 1% | Voltage(V) | TEMP. | Resistance K ± 1% | Voltage(V) | TEMP. | Resistance K ± 1% | Voltage(V) |

5-2 Part Name & Disassembly

9. Disassembly & Assembly

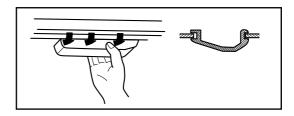

1. Replacement of refrigerator lamp

į

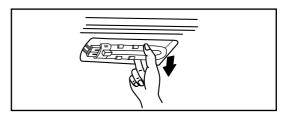

Warning

Always take out the power plug when replacing the refrigerator lamp. There is the danger of electric shock.

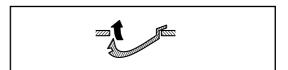

1. Remove the cover with the back latch pressed.

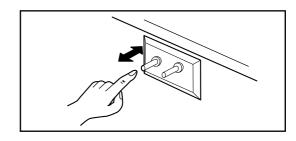

2. Pull out the lamp.

3. After replacing the lamp, assemble the front latch of cover and then connect the back latch.

4. Plug in and check if power is cut off or not by pressing the R-door switch.

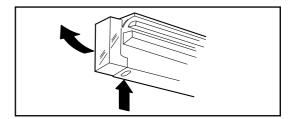

2. Replacement of freezer lamp

Î

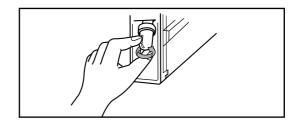

Warning

Always take out the power plug when replacing the refrigerator lamp. There is the danger of electric shock.

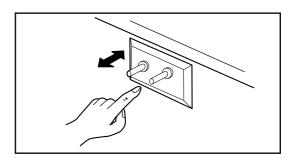

1. Remove the cover by pressing the bottom latch.

2. Replace the lamp by turning it counter-clock wise.

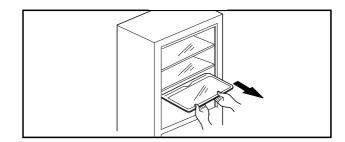

3. Reassemble the cover in the reverse order of disassembly and plug in and the check if power is cut off by pressing the door switch.

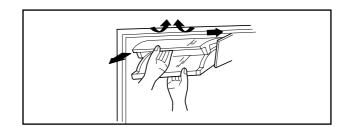

3. Disassembly of the cooling cycle in the r efrigeration room

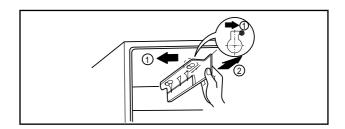

1. Take out food stuffs and trays from refrigeration room.

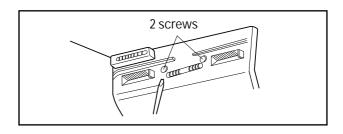

2. Bend the cover of chilled compartment and remove the left axis.

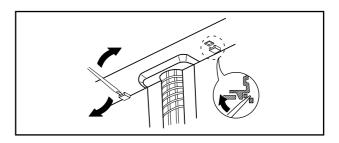

3. Move the holder of chilled compartment to the arrow $\ensuremath{ \mathfrak{D}}$ and pull it out.

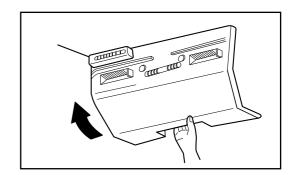

4. Remove 2 cap screws with (-) driver or similar tools.

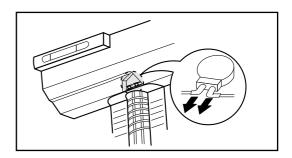

5. Remove 2 latches from the bottom of the cover in the front of evaporator.

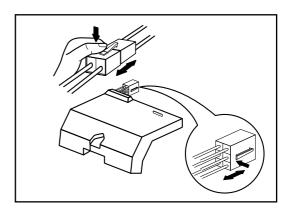

6. Remove the evaporator cover by pulling out the bottom of the evaporator cover.

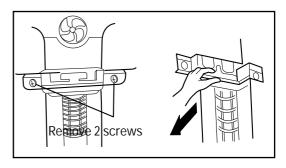

7. Remove the housing of wires from the center of the cooling cycle unit and remove the terminal from the geared motor.

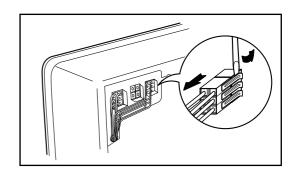

8. Pull forward the insulating material of the cooling cycle unit and remove the wire terminal and insulating material.

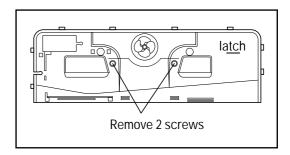

9. Remove 2 screws securing refrigerator duct and pull it out by following the arrow.

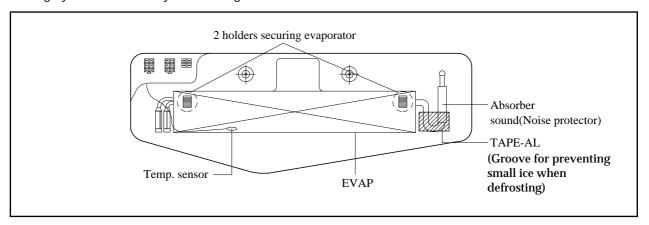

10. Remove the wire terminal from the left top of refrigeration room

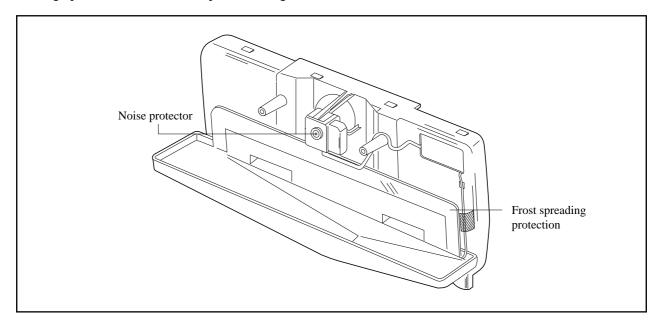

11. Remove 2 screws securing the back cover of cooling cycle unit and remove the left and right latches with (-) driver.

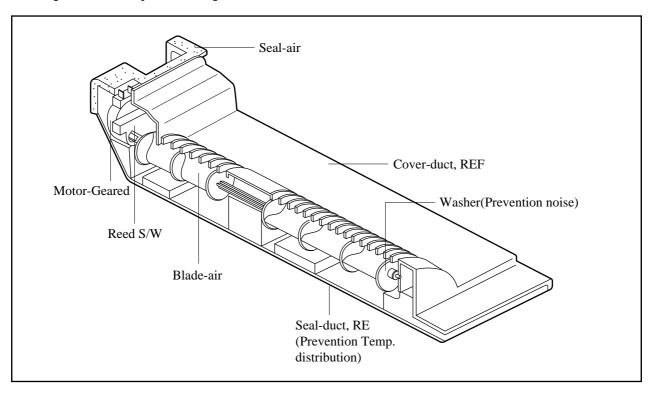

■ Cooling cycle unit assembly in the refrigeration room

■ Cooling cycle unit cover assembly in the refrigeration room

■ Rotating duct assembly in the refrigeration room

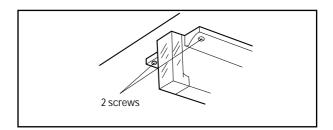

4. Disassembly of the cooling cycle unit in the fr eezer

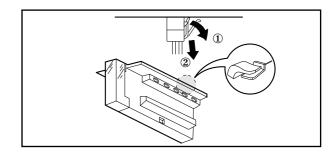

1. Take out the case from the freezer.

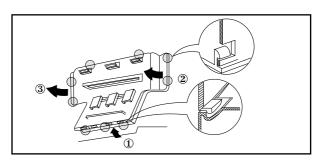

2. Remove 2 screws from the holder of the cooling cycle unit.

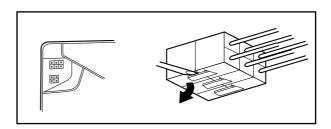

3. Pull out the holder of the cooling cycle unit and disconnect wire terminals.

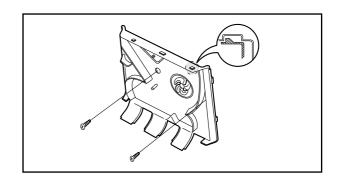

4. Remove the latch of the cooling cycle unit cover from the bottom.

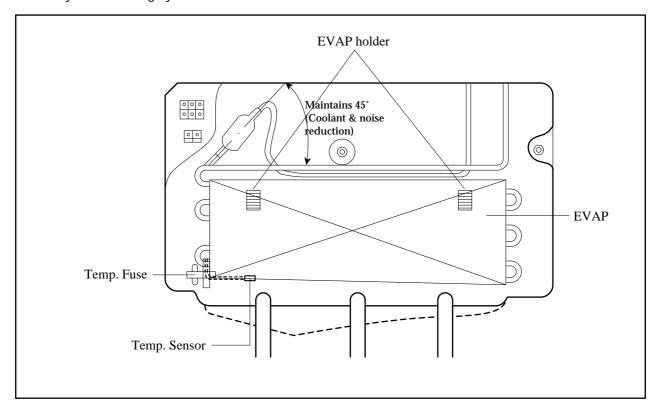

5. Remove each terminal from the top of the left wire assembly.

6. Remove 2 screws from the back cover of the cooling cycle unit and remove the latch with (-) driver.

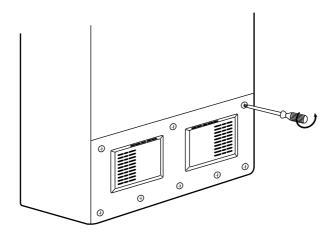

■ Assembly of the cooling cycle unit in the freezer

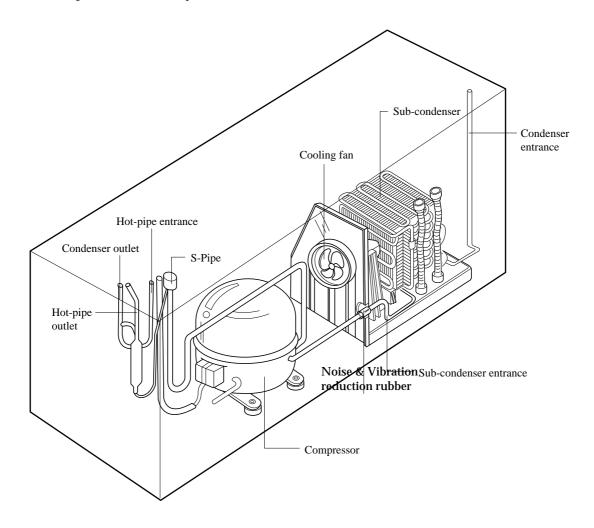

5. Assembly of mechanic compartment in the refrigerator

1. Remove the screws securing the mechanic compartment cover of the back bottom of the refrigerator.

2. Mechanic compartment assembly

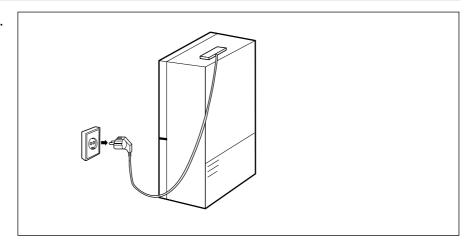

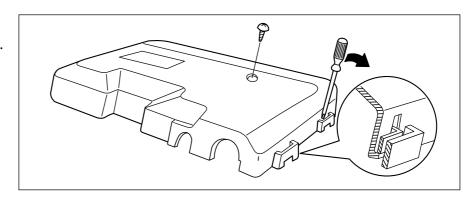

Warning

Make sure the power plug is taken out when replacing the components for the main PCB.

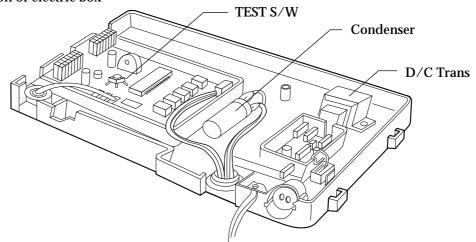

1. Disconnect the power cord.

2. Remove the cover of electrical box with – driver.

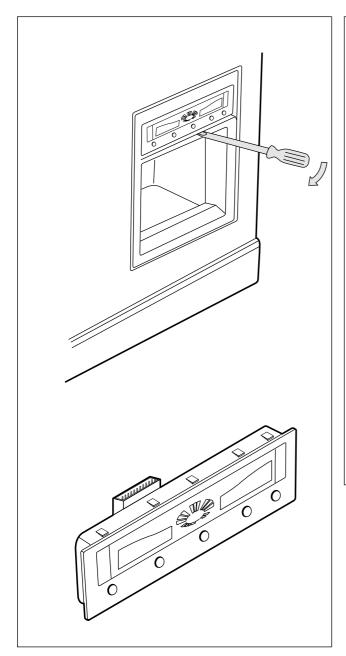

3. Assembly specification of electric box

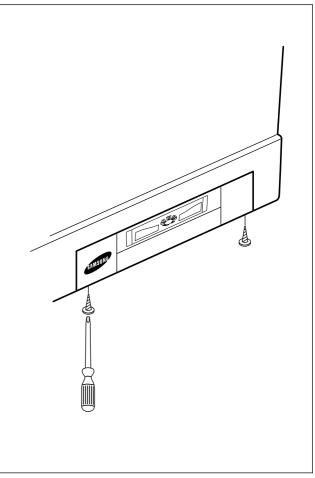

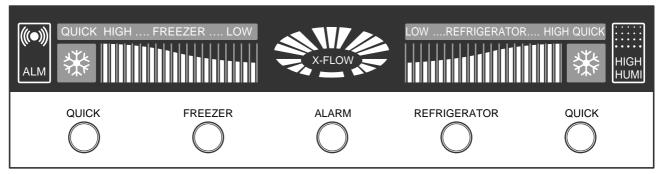

7. Temperature controller disassembly

1. With dispenser model.

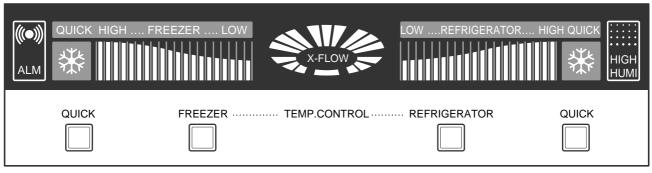

2. Without dispenser model

SR-L628/678EV

SR-L626/676EV

1. Temperature Control Functions

A. Temperature control in the freezing compartment

- 1) Select the 5 STEPS of 'MED'-'MED · HIGH'-' HIGH'-'LOW'-'LOW · MED' with one button.
- 2) When-ever the temperature control button of freezer is pressed, it continues to light from "MED" to "LOW \cdot MED".
- 3) When power turns on "MED" is automatically selected.

| Category | Initial power on | Pressed once | Pressed twice | Pressed 3 times | Pressed 4 times | Remark |
|-----------------|------------------|--------------|---------------|-----------------|-----------------|--------|
| Indicator Lamp | → MED | ►MED·HIGH- | ≻ HIGH | > LOW | ►LOW·MED | |
| Reference Temp. | −17.5°C | −19.5°C | −21°C | −15°C | −16.5°C | |

B. Temperature control in the refrigeration compartment

- 1) Select the 5 stages of 'MED'-'MED · HIGH'-'HIGH'-'LOW'-'LOW · MED' with a button.
- 2) Whenever the temperature control button of refrigerator is pressed, it continues of light from 'MED' to 'LOW \cdot MED'.
- 3) When power turns on "MED" is automatically selected.

| Category | Initial power on | Pressed once | Pressed twice | Pressed 3 times | Pressed 4 times | Remark |
|-----------------|------------------|--------------|---------------|-----------------|-----------------|--------|
| Indicator Lamp | → MED | ►MED·HIGH- | ≻ HIGH | → LOW | ►LOW·MED | |
| Reference Temp. | 3°C | 1°C | -1°C | 6°C | 4.5°C | |

C. Power freezing and power refrigeration function

- It is selected by the special power freezing · refrigeration button.
- Whenever the power freezing · refrigeration button is pressed, it repeats turning on and off.
- When power turns on at first, it is selected to off automatically.
- When the power freezing · refrigeration button is selected, the temperatures of freezer and refrigerator do not change. But, the temperatures can be set again after it is selected.

1) Power Freezing Function

- ① If power freezing is selected, COMP and F-FAN operate for 2 and 30 hours.(In 1 minute after selection)
- ② If power freezing function finishes, power freezing lamp turns off.
- 3 If power freezing function is selected, refrigerator is controlled by the fixed notch.

2) Power Refrigeration Function

- ① If it is selected, it continues until COMP and R-FAN reaches to -4°C.
- ② The power refrigeration finishes if COMP and R-FAN does not reach −4°C even though 2 and 30 hour operation.
- ③ If it is selected, refrigerator is controlled by the fixed notch.
- 3) When the power freezing · refrigeration are selected simultaneously
 - 1 Each function is carried out at the same time.

2. Alarm function

A. Button touch(Ding-Dong Sound)

- 1) When each button on the control panel is pressed, the beep sounds to confirul the key input.
- 2) The beep does not sound if wrong-touch.

B. Door open(Ding-Dong Sound)

- 1) When the door of either freezer of refrigerator is open for more than 2 minutes, the alarm rings.
- 2) The alarm rings for 10 seconds every one minute. When the door closes, the alarm goes off immediately.
- 3) Door open alarm rings when the display button is selected. But door open alarm stops immediately if the button is released.
- 4) If the alarm is selected by the button, the alarm rings regularly.
- 5) Alarm by the alarm button includes only door open.
- 6) Model SR-L676EV, SR-L626EV follows the above alarm procedure without alarm select button.

C. Forced starting · Forced defrosting (beep sound)

- 1) If the forced starting \cdot forced defrosting are selected the beep tone sounds.
- 2) When forced starting, the beep sounds until being completed(24 hours) or released.
- 3) When forced defrosting, the beep sounds until being completed(including pause) or released.

3. Defrosting function

A. Quick defrosting function

1) When power turns on at first, the first defrosting is carried out after compressor operates for 4 hours.

B. Standard defrosting function

- 1) Defrosting is divided into freezer defrosting, refrigerator defrosting and natural defrosting. The defrosting of freezer and refrigerator is determined by the operation time of compressor.
- 2) Defrosting interval can vary from 6~32 hours.

C. Natural defrosting of Refrigerator

1) Natural defrosting is carried out if the compressor turns off and fan keeps on for some period.

4. Test function

A. Forced starting function

- 1) The test functions are designed for PCB, product test, process inspection and service activities.
- 2) The test switch is on the main PCB and when pressed once, it immediately works cooling without comp delay.
- 3) If the forced starting is selected, freezer and refrigerator notches are selected to "HIGH" and "HIGH" · MED". Comp and F-Fan are controlled by pull-down and R-Fan is controlled by "HIGH · MED" notch.
- 4) The pull-down function of forced starting maintains for 24 hours and it returns to normal operation after defrosting(F, R) is automatically carried out.
- 5) During forced starting, all button inputs are available. Forced starting can be released when power turns on after off or by the test release mode.
- 6) During forced starting, the beep continues to sound (0.25 sec. ON/0.75 sec OFF) until defrosting is completed.

B. Forced defrosting function

- 1) If the test button is pressed once during the forced starting, refrigerator is defrosted forcedly.
- 2) If it is pressed twice, freezer and refrigerator carry out defrosting at the same time.
- 3) When the forced defrosting is carried out, the forced starting is released and returns to normal operation.
- 4) When the forced defrosting is carried out, the notches of freezer and refrigerator maintains the notch fixed prior to forced starting.

C. Test mode release

- 1) If the test button is pressed twice during forced defrosting, the forced defrosting is canceled and returns to normal operation.
- 2) If the test release mode is selected, the buzzer will stop.

5. Self-diagnosis function

A. Self-diagnosis function with initial power on

- 1) If the power is supplied to refrigerator at first, all displays are on and self-diagnosis function is carried out.
- 2) If there is no defect on MICOM, display returns to the initial normal mode("Med"-"HIGH humidity"-"Alarm").
- 3) If there is defect, the televant display lights off with the sound of the beep.
- 4) Self-diagnosis error indicator might disappear when defect is repaired or self-diagnosis function is released.
- 5) If defect is repaired, display returns to normal mode.
- 6) Self-diagnosis function is canceled when "power freezing" button and "power refrigeration" button are pressed for 5 seconds at the same time. Display returns to normal mode.

B. Self-diagnosis function during normal operation

- 1) Press "power freezing" button and "power refrigeration" button for 5 seconds at the same time during normal operation.
- 2) The temperature LEDs of freezer and refrigerator repeats 1 second on/off 3 times.
- 3) If any button is not pressed until the temperature LED repeats on/off 3 times, self-diagnosis function is carried out. If there is no defect, it returns to normal mode.
- 4) If there is defect, the corresponding display will light up and buzzer will beep.
- 5) Self-diagnosis error indicator works for 30 seconds and returns to normal mode regardless of defect correction.
- 6) Key input is not available during self-diagnosis function.
- 7) When there is defect, the corresponding display is shown as initial power on.

| No | Item | Display LED | Symptom | Remark |
|----|------------------|-----------------------------|---|--|
| 1 | R1-Sensor | Refrigerator "LOW" | R-room left sensor housing disconnection. Faulty connection. Wire open or short. Faulty sensor. | R1-Sensor temperature is over +50°C or below -50°C. |
| 2 | R2-Sensor | Refrigerator "LOW · Med" | R-room left right sensor housing disconnection. Faulty connection. Wire open or short. Faulty sensor. | R2-Sensor temperature is over +50°C or below -50°C. |
| 3 | RD-Sensor | Refrigerator "Med" | R-room defrost sensor housing disconnection. Faulty connection. Wire open or short. Faulty sensor. | RD-Sensor temperature is over +50°C or below -50°C. |
| 4 | Air-Sensor | Freezer "LOW" | Outer sensor housing disconnection.Faulty connection.Wire open or short.Faulty sensor. | Outer-Sensor temperature is over +50°C or below -50°C. |
| 5 | F-Sensor | Freezer "LOW" · Med" | F-room sensor housing disconnection. Faulty connection Wire open or short. Faulty sensor. | F-Sensor temperature is over +50°C or below -50°C. |
| 6 | FD-Sensor | Freezer "Med" | R-room defrost sensor housing disconnection. Faulty connection. Wire open or short. Faulty sensor. | F-Sensor temperature is over +50°C or below -50°C. |
| 7 | Geared- Motor | Refrigerator "HIGH" | Faulty geared-motor Faulty reed-switch housing disconnection. Faulty connection. | Square wave not detected by reed-S/W. |

(Self-diagnosis Display Table)

C. Load status display

- 1) When "power freezing" button and "power refrigeration" button are pressed for 5 seconds during normal operation, it is activated by the refrigeration button while temperature setting display repeats on/off 3 times.
- 2) Load which output of micom is displayed on LED.
- 3) Load status display maintains for 60 seconds and returns to normal operation.

| No | Item | Display LED | Display |
|----|--------------------------------|------------------------------|--|

(Load Status Display Table)

6. Option function

| 1) Freezer Temperature Shift | | | | | | | (Unit | : °C) | |
|------------------------------|----|----|----|----|-------|----|-------|-------|----|
| SHIFT | 14 | 13 | 12 | 11 | SHIFT | 14 | 13 | 12 | 11 |
| Reference | 0 | 0 | 0 | 0 | +0.5 | 1 | 0 | 0 | 0 |
| -0.5 | 0 | 0 | 0 | 1 | +1.0 | 1 | 0 | 0 | 1 |
| -1.0 | 0 | 0 | 1 | 0 | +1.5 | 1 | 0 | 1 | 0 |
| -1.5 | 0 | 0 | 1 | 1 | +2.0 | 1 | 0 | 1 | 1 |
| -2.0 | 0 | 1 | 0 | 0 | +2.5 | 1 | 1 | 0 | 0 |
| -2.5 | 0 | 1 | 0 | 1 | +3.0 | 1 | 1 | 0 | 1 |
| -3.0 | 0 | 1 | 1 | 0 | +3.5 | 1 | 1 | 1 | 0 |
| -3.5 | 0 | 1 | 1 | 1 | +4.0 | 1 | 1 | 1 | 1 |

| 2) Refrigerator Temperature Shift | | | | | | (Unit °C) | | | |
|-----------------------------------|----|----|----|----|-------|-----------|----|----|----|
| SHIFT | 18 | 17 | 16 | 15 | SHIFT | 18 | 17 | 16 | 15 |
| Reference | 0 | 0 | 0 | 0 | +0.5 | 1 | 0 | 0 | 0 |
| -0.5 | 0 | 0 | 0 | 1 | +1.0 | 1 | 0 | 0 | 1 |
| -1.0 | 0 | 0 | 1 | 0 | +1.5 | 1 | 0 | 1 | 0 |
| -1.5 | 0 | 0 | 1 | 1 | +2.0 | 1 | 0 | 1 | 1 |
| -2.0 | 0 | 1 | 0 | 0 | +2.5 | 1 | 1 | 0 | 0 |
| -2.5 | 0 | 1 | 0 | 1 | +3.0 | 1 | 1 | 0 | 1 |
| -3.0 | 0 | 1 | 1 | 0 | +3.5 | 1 | 1 | 1 | 0 |
| -3.5 | 0 | 1 | 1 | 1 | +4.0 | 1 | 1 | 1 | 1 |

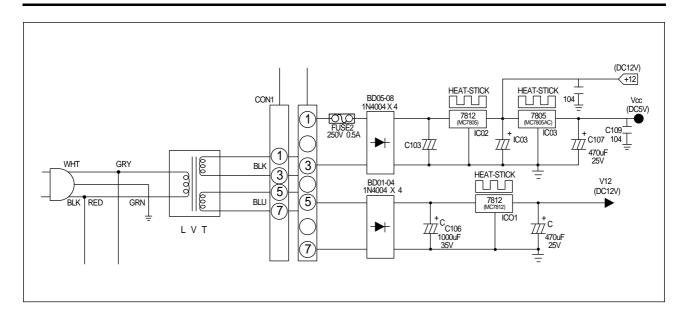

- 1) Method: The temperature of the freezer and refrigerator can be compensated from +4.0 to -3.5°C.
 - Reference : Freezer (-17.5°C) Refrigerator(+3.0°C)

As above table • Shift No 1, 2, 3, 4 are designed to compensate freezer temperature (PCB D601, D602, D603, D604)

- Shift No 5, 6, 7, 8 are designed to compensate refrigerator temperature (PCB D605, D606, d607, D608)
- "0" means non-diode (IN4148)
 - "1" means diode

6. Circuit Descriptions

1. Power cir cuit

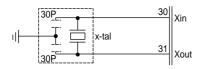

| Voltage | Circuit used | | | |
|--|--------------------------------------|--|--|--|
| —————————————————————————————————————— | Relay Operation | | | |
| —— Vcc (DC 5V) | Power around MICOM & Sensor Detector | | | |
| ── ▶ V12 (DC 12V) | LED Display & S/W Detector | | | |

The input AC voltage of DC-trans secondary registers 15V at CON1 between $\textcircled{1}\sim\textcircled{3}$. The rectified voltage passed through BD05 \sim 08 becomes DC 12V through voltage regulator MC7812(IC02). The power(DC12V) is supplied to the relay operation power block. Then, DC 5V is genetatel and supplied to the power around micom and sensor detector through 7805(IC03).

The rectified voltage passed through BD01~04 passes through 7812(IC01). Then, DC12V is supplied to LED display and switch detector.

2. Oscillator

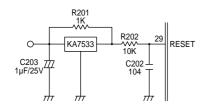

| Port | Oscillating Fr equency | |
|------|------------------------|--|
| Xin | 4.00MHz | |
| Xout | 4.00MHz | |

±0.5% Error

It is designed for clock generation and time calculation for synchronizing transmission and reception on the logic elements inside the MICOM. If the X-TAL specification changes, MICOM may make an error. The standard components should be used.

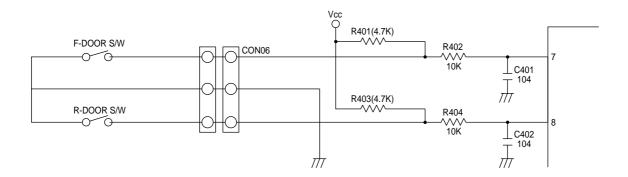

3. Reset Circuit

| Port | Voltage | | |
|------|------------|--|--|
| Xin | 5 V | | |
| Xout | 5V | | |

When power is supplied to MICOM, reset circuit initializes RAM and other parts on MICOM to initialize all programs. Reset voltage maintains "low" for hundreds of µsec comparing to MICOM Vcc voltage when power is input. It also maintains "high" (5V) during normal operation. But, when Vcc drops to 3.3V, reset port becomes "low".

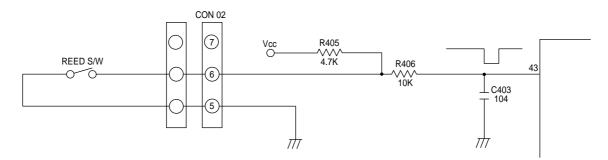

4. Door S/W Detector

| DOOR | Door Conditions | Door S/W Contact | MICOM PIN NO | Micom Input Voltage |
|------|-----------------|------------------|-----------------|---------------------|
| F | CLOSE | OPEN | " ~ | "LOW" |
| F _ | OPEN | CLOSE | # 7 | "HIGH" |
| | CLOSE | OPEN | " 0 | "LOW" |
| R | OPEN | CLOSE | # 8 | "HIGH" |

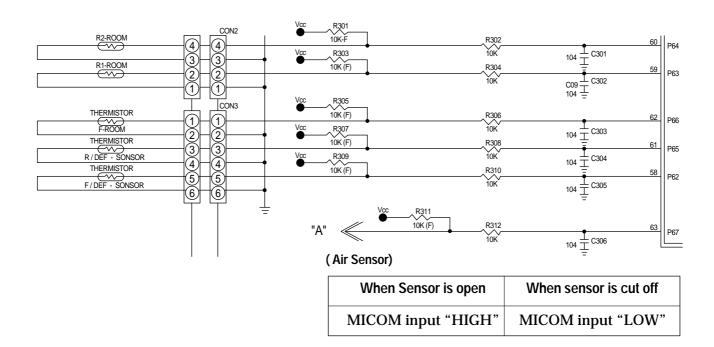

- 1) If door is open, door S/W contact is closed. Then MICOM receives "low" signal and detects door open.
- 2) If door is closed, door S/W contact is open. Then MICOM receives "high" signal and detects door close.

5. "V" Motor Position Detector(Reed S/W)

- 1) The position of "V" motor for controlling the G.A-fuzzy of the temperature in the refrigeration room is detected by the reed switch.
- 2) When MICOM Pin 43 changes 'high' to 'low' by the operation of fan, MICOM detects the position of "V" motor.

6. Temperature Sensor

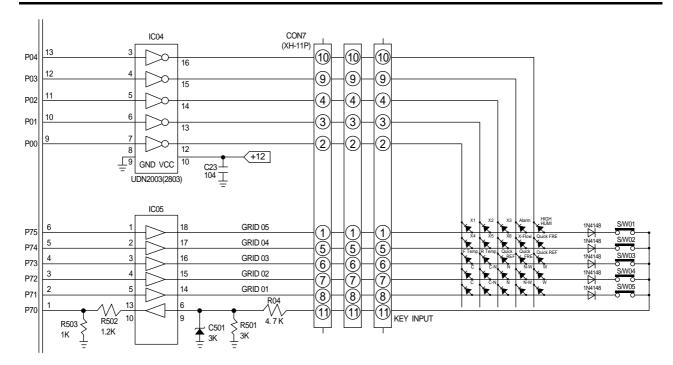

- 1) The sensor uses the characteristics of thermistor. If temperature goes higher, resistance goes lower. On the contrary, if temperature goes lower, resistance goes higher.
- 2) MICOM input voltage is counted by sensor as follows.

$$V_F = \frac{R_{TH}}{R_{TH} + R_{24}} \times V_{CC}$$
 (VCC: 5V, RTH: Sensor reisitance)

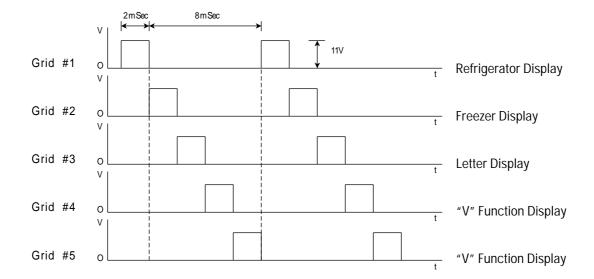

3) For the resistance information on temperature and MICOM input voltage, please refer the conversion table. (Page. 41)

7. Key scan and display circuitry

1) Key scan and display operation

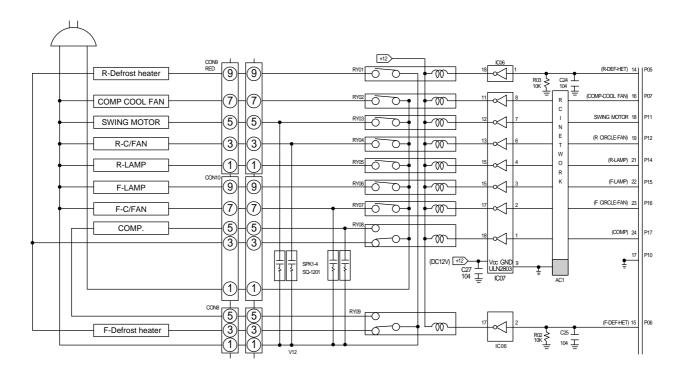

As shown in the following waveform, MICOM pins $\#2 \sim \#6$ output are high for 2msec per 10msec. MICOM pin #2 = #3 = #4 = #6 output repeats. The signal is output through IC05(UDN 2981A). At that time, the peak to peak voltage of square signal registers around 11V. The grid $\#1 \sim \#5$ waveforms are as follows.

2) Key Scan

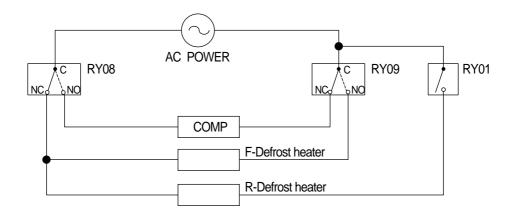

The grid waveform of each output is supplied to each button line through switching diode (IN4148). The grid #1 signal goes to the setting button of refrigerator. Then, refrigerator button is pressed, around 4.5V goes to IC05(UAN2981A) pin 8 through key input line. MICOM detects the refrigerator button pressed after MICOM pin1 receives the signal.

8. Load Operation

If MICOM outputs "high" signal to driver-IC(ULN 2803) according to each load operation conditions, IC turns on and DC 12V flows to ground through the relevant relay coil. Then, core is magnetized by the coil current, and relay contact switches on. When relay contact is on, AC POWER is supplied to the relevant operation load, then which will be activated. If MICOM outputs "low" signal, load operation stops with the relevant relay contact off.

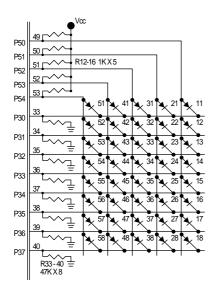

1) Compressor and Defrost Heater

As above block diagram, the commons of compressor relay(RY 08) and defrost heater relay(RY 09, RY 01) are respectively connected to AC POWER line. If relay is not activated(OFF) contact maintaills NC, and compressor and defrost heater are all off, activated and contact is switched on. Then, AC POWER is supplied to compressor activated. On the contrary, if defrost heater relay operates, defrost heater is activated. Compressor and defrost heater do not operate simultaneously under any conditions of relay.

| RELAY | | Lood | Remark |
|-------|-----------|------------------------------|--------------------------|
| COMP | Defrost H | Load | Remark |
| on | off | Comp Operation | Defrost-Heater Power Off |
| on | on | Comp off, Defrost-Heater Off | |
| off | on | Defrost-Heater On | Comp Power Off |
| off | off | Comp Off, Defrost-Heater Off | |

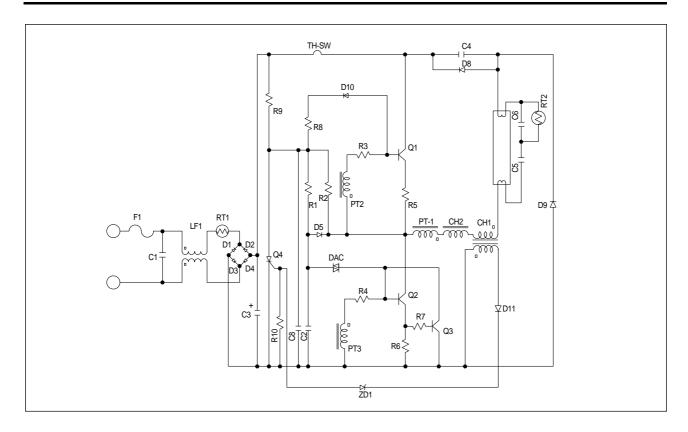

9. Other option functions

Temperature and function values are changeable by using main PCB switching diode.

 Note: If possible, do not change be cause the values have been set in factory. When changing option functions, power should be turned off.
 (Only initial power-on allows reading option function)

10. PCB Sub Ass'y(Inverter PCB)

1) Power circuit

PCB sub ass'y (Inverter PCB) is activated with AC POWER input when the refrigerator door is open and R-lamp relay(RY05) is activated. If the AC POWER is supplied to the power block, the smooth capacitor(C3) gets around VOLTAGE DC(VOLTAGE AC X 2) AC POWER through rectification.

2) Lamp

If power is supplied to the PCB sub ass'y, diac(DB4) is activated. When C4 is over 35C/DC, voltage is supplied to TR Q2 base by the continuity of diac. Then, TR Q2 is activated.

When TR Q2 is activated, current flows to C5 – C6 – CH1 – PT1 – R9. At that time, current flows to PT2 and PT3.

If the discharge of capacitor C6 is completed, reverse current flows to PT2 and PT3 and TR Q2 turns off TR Q3 turns on. The current flows to PT1 – CH1 - C6 - C5 - C8.

Lamp light up by the repetition of TR Q2, Q3 on/off. Its frequency range is 30~40KHz during on/off.

3) PTC and PTC protector

PTC is designed to smooth the lighting and to lengthen lamp's life by heating filament of lamp. The PTC protector prevents damage from PTC by cutting off power through triac if filament emits high voltage at the beginning of lighting.

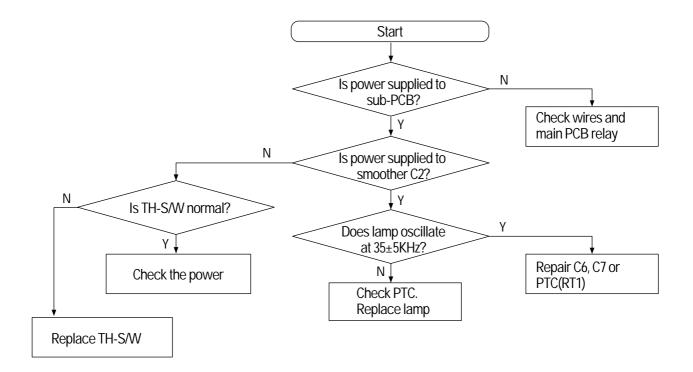

To check the PTC, measure resistance (150 \pm 25% is normal). But, PTC resistance can be challged by the ambient temperature and PTC operation. The above resistance value is counted in 20 sec after lamp is off with the temperature 25°C.

4) Troubleshooting

Precautions

- 1. Is the power cord well connected to wall outlet?
- 2. Be careful of high-voltage discharge because high voltage DC power is supplied to SUB-PCB.

① When the light dosen't come on in the refrigerator

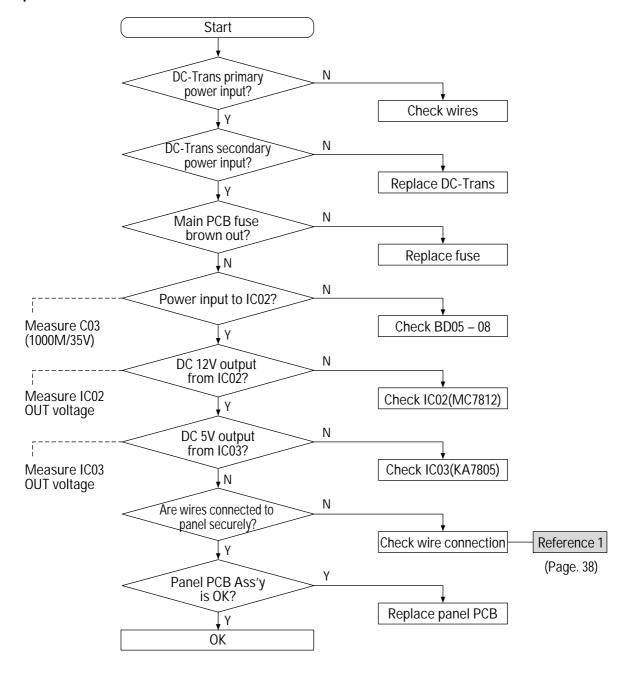

- * PTC should be inspected before replacing lamp.
- * Be careful of high voltage discharge, when repairing unit.

7. Troubleshooting

Precautions

- 1. Is the power cord well connected to wall outlet?
- 2. Refer to the reference

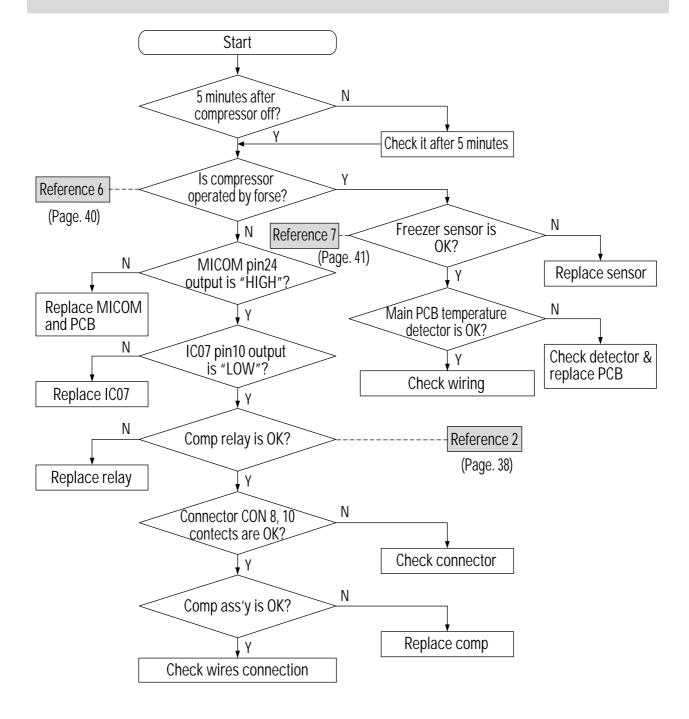

1) No power

2) Compressor does not run

Precautions

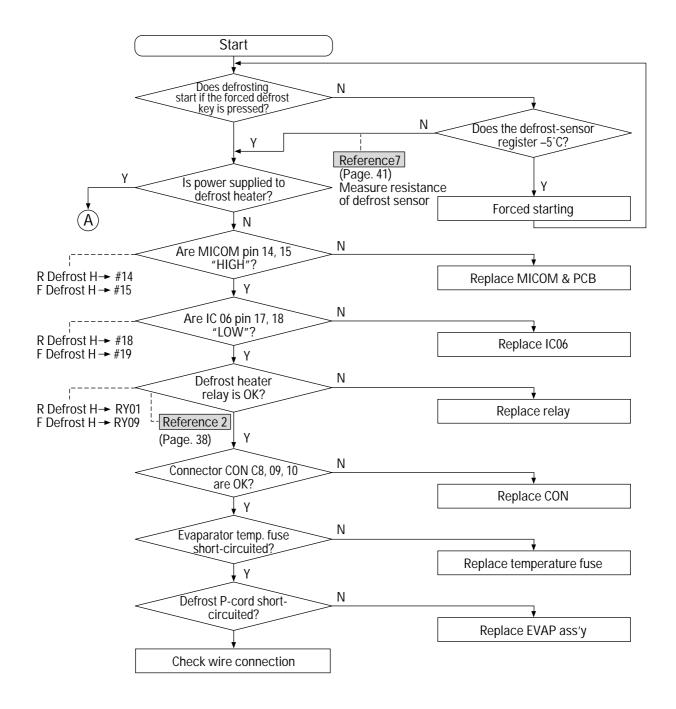

- 1. Compressor does not operate in 5 minutes after power ON and compressor OFF.
- 2. Compressor does not run during defrosting.
- 3. Compressor does not run because low temperature is detected if freezer sensor is not connected.

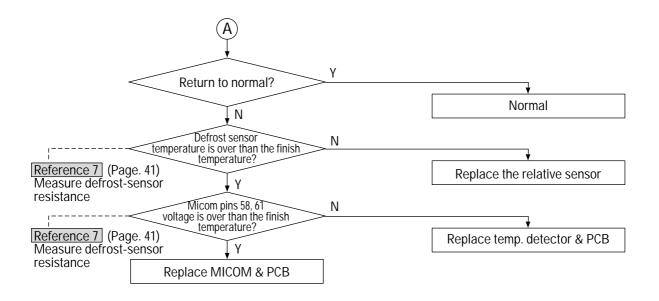

3) No defrosting

Precautions

- 1. Even though both F·R-defrost sensors short-circuit, normal operation continues without defrosting.(Refer to self-diagnosis function)
- 2. Even though the temperature fuse is off, there is no heating but defrosting natural temperature increase comp off-time takes longer.
- 3. Even though both F·R-defrost sensor are open, heating does not end and comp-off maintains with temperature fuse short-circuited.(Refer to self-diagnosis function)

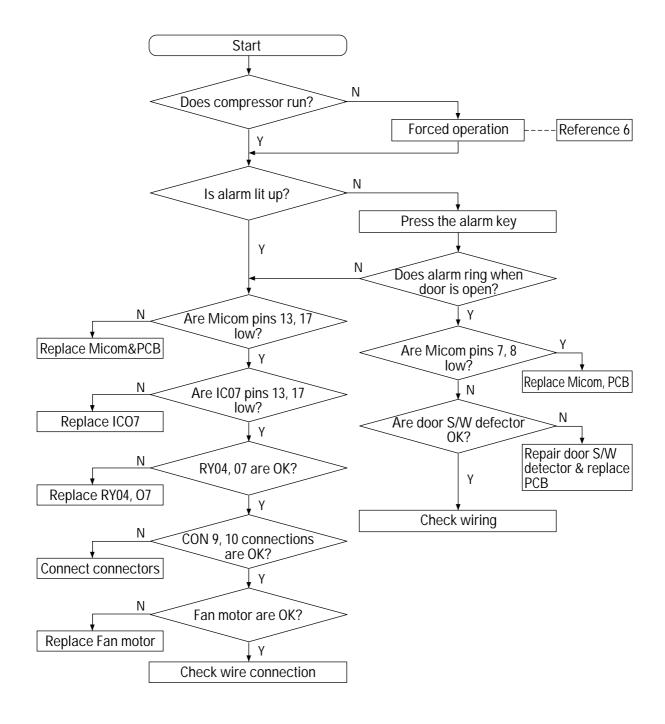

5) Fan-motor does not run

Precautions

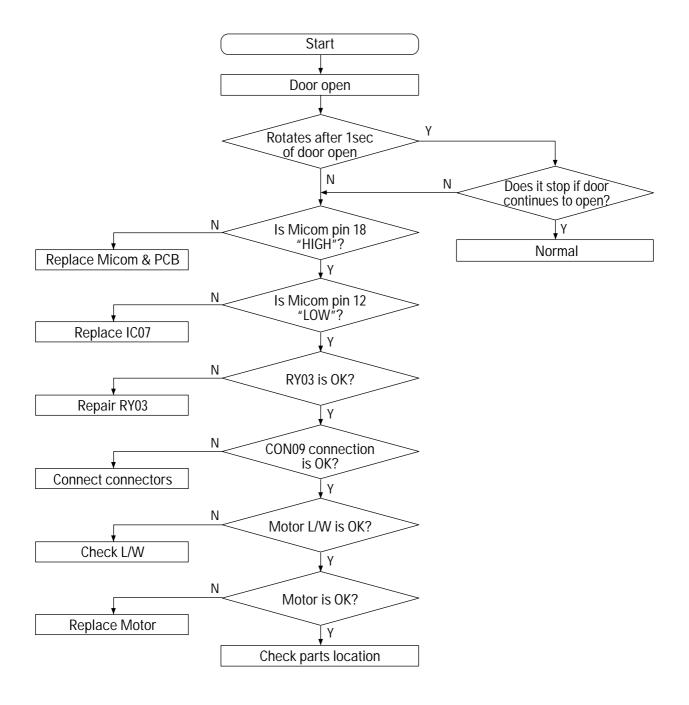

- 1. Compressor operates but fan does not run(F·R doors open)
- 2. Check door close

5) Fan motor in the refrigeration room does not work

Precautions

- 1. Fan-motor operates with 2 modes.(Static or Rotation)
- 2. Fan-motor rotates for 30 seconds after one second of door open.

6) Lamp Inspection

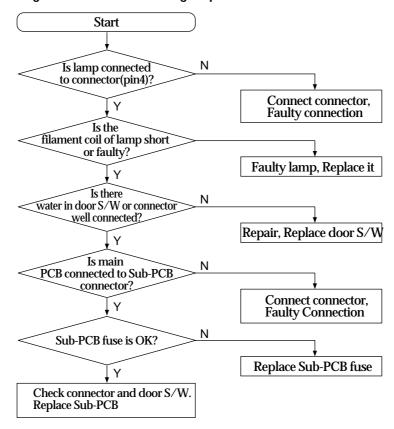

Note

- 1. When replacing Sub-PCB, power should be turned off, because Sub-PCB receives AC POWER INPUT and converts that to 1.5 X AC POWER INPUT.
- 2. It is impossible to check lamp with normal voltage tester, because lamp voltage is high.

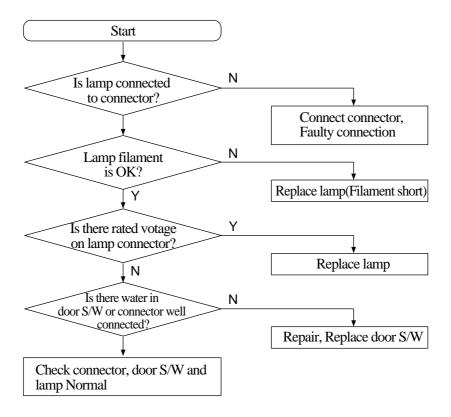

References

- 1. If new lamp does not turn on, that's because the protector is activated to prevent peak voltage when lamp is replaced.
 - After replacing lamp, wait for 30 seconds after closing the door of refrigerator.
- 2. Lamp turns off automatically if the door of refrigerator is open for 10sec If door is closed and opened by the door S/W, lamp turns on again. If that carries out over twice, protector is activated and lamp maintains off.
- 3. If there is water in door S/W, lamp close not turn or off because Micom can not receive door open/close signal. Door S/W should be checked.
- 4. The connection between Main-PCB and Sub-PCB, Sub-PCB output and cabinet L/W, cabinet L/W and lamp are done by connector. If there is table with lamp check connector and lamp.
- 5. Freezer lamp is controlled by main PCB.

1 Lamp in the refrigeration room does not light up

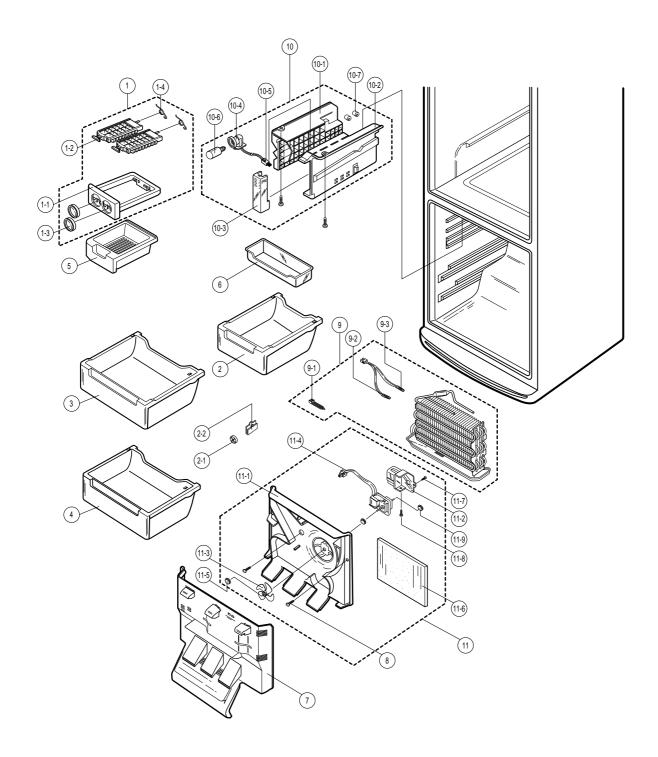

2 Lamp in the freezer does not light up

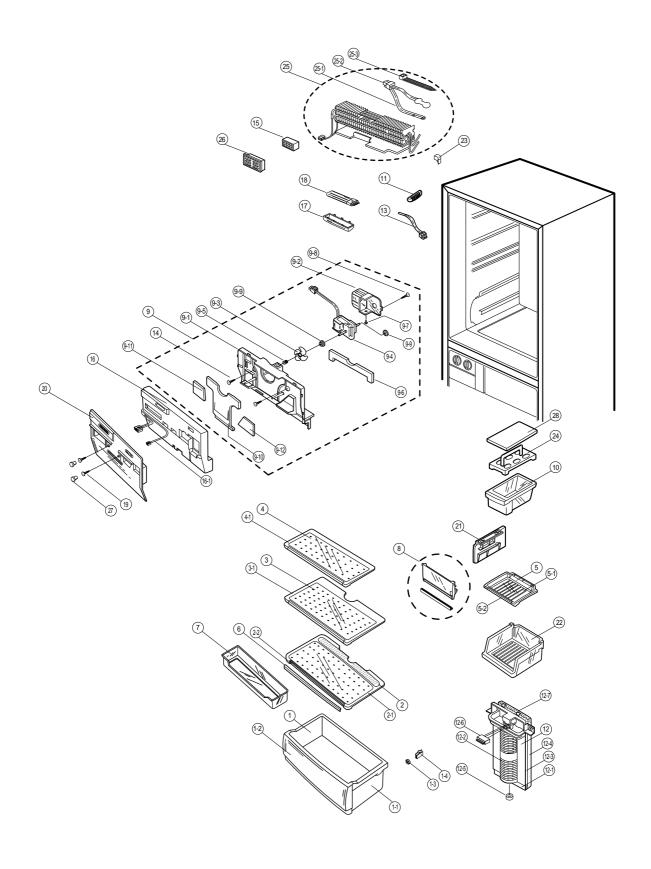

8. Part List
